Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Customer Journey Map

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	A government analyst or meteorologist compiles historical climate features (annual/seasonal rainfall, cloud visibility) and uploads them to validate baseline system parameters.	A meteorologist logs into the dashboard and submits localized current rainfall and visibility values for an at-risk district to get instant risk classifications.	A disaster relief coordinator reviews real-time prediction result statuses across multiple monitored regions simultaneously to plan tactical asset deployment
Touchpoint <i>What part of the service do they interact with?</i>	The backend preprocessing architecture, historical data ingestion split-pipelines, and data scaling configurations.	The responsive web application browser interface and the UI Prediction Input form fields.	A disaster relief coordinator reviews real-time prediction result statuses across multiple monitored regions simultaneously to plan tactical asset deployment.

Customer Thought <i>What is the customer thinking?</i>	<i>Are these meteorological variables clean enough to yield reliable prediction metrics, and did the data scaling run accurately?</i>	Can this trained model quickly map these extreme weather parameters to give us enough hours to issue actionable evacuation orders?"	<i>"The system is reporting extreme flood risk with 96.55% reliability—we must prioritize our logistics teams to these target zones immediately."</i>
Process Ownership <i>Who is in the lead on this?</i>	Shaik Jasmin ((Data Preprocessing & Feature Engineering).	Vinuthna Jignasa Malleti (Team Lead / Flask Backend Developer).	Mounika Chillara (Application building) Ramavath Mallikarjuna Naik (Cloud Deployment Infrastructure)
Opportunities <i>How can we improve this stage?</i>	Embed automated data cleansing scripts to isolate and impute extreme weather outliers or missing inputs seamlessly prior to core algorithm execution.	Integrate automatic map-based geolocation lookups so users do not have to type meteorological telemetry values entirely by hand.	Create a notification web-hook connection to automatically push critical high-risk prediction alerts directly to field response teams.
